

ENERGY AND CARBON MANAGEMENT POLICY

As a responsible company with a long term view, at Capital Concrete our leadership team is accountable for ensuring that we:

- support Government and the MPA's Net Zero strategy and comply with relevant legislation for reducing carbon emissions
- meet industry level targets from relevant trade associations such as the Mineral Products Association, British Precast Concrete Federation and British Ready Mixed Concrete Association (BRMCA).

We are committed to ensuring our products and services are manufactured, processed and delivered by the efficient use of energy and an ongoing reduction in our carbon footprint,* that the business maximises responsible resource use through improved operational efficiency and support the management team in encouraging employees to work towards our carbon reduction targets.

In order to achieve this, we will:

- benchmark and set improvement targets with respect to energy and carbon emissions and create an annual improvement plan
- consider energy efficiency and carbon emissions when purchasing any new plant or equipment and in the running of existing operations including in the delivery of products to customers (see our Transport Policy)
- reduce or replace cementitious contents by incorporating secondary alternatives with lower embodied carbon where appropriate

- target electricity from 100% renewable sources
- where viable integrate alternative energy sources into our operations
- continue to share best practice and promote and improve the reduction in energy consumption and carbon emissions
- measure and record our consumption of energy and carbon emissions through regular internal audits and reviews
- externally verify performance data, reporting it to key trade stakeholders and reviewing it through systems audited by accredited certification bodies
- utilise the recommendations from industry experts such as the Energy Savings Opportunity Scheme (ESOS) to deliver reductions in energy consumption and carbon emissions in order to achieve net zero by 2050.
